

Stand-Ups

1.) What was achieved last week?

- Changed the Semester field in DTOs to use an enum so it only accepts correct values.
- Changed the Status field to a true/false (bool) for active or inactive.
- Commented out the Authentication and JWT for now because it's too advanced.
- Updated the DTOs so they match the new Semester and Status types.
- Tested the API using Swagger to make sure everything still works.

2.) What is the focus for today?

- Make sure the DTOs and controllers work well with the new Semester and Status types.
- Add checks to make sure the input for Semester and Status is correct.
- Double-check that all API endpoints respond correctly.
- Prepare for when we add Auth/JWT later.

3.) What blockers exist?

- Making sure the **controllers still work** after changing Semester to enum and Status to bool.
- Making sure Swagger shows the correct values for enums and booleans.

Retrospective

- 1.) What went well? (Wins/Successes)
 - Successfully updated **Semester** and **Status** to proper types.
 - API endpoints are still working after the changes.
 - Swagger testing helped confirm that everything responds correctly.
- 2.) What didn't go well? (Problems/Challenges)
 - Updating DTOs and controllers was tricky because changes could break endpoints.
 - Testing enums and booleans took extra care to make sure they worked.
- 3.) What should we start doing? (Improvements)
 - Add proper **input checks** for Semester and Status.
 - Make DTOs more **consistent** across the project.
- 4.) What should we stop doing? (Waste/Inefficiencies)
 - Stop changing DTOs without checking if the controllers will break.
 - Stop testing endpoints without considering the new types for Semester and Status.
- 5.) What should we continue doing? (Best Practices)
 - Keep DTOs clear and controllers organized.
 - Always test endpoints after changing anything important.
