

Stand-Ups

1.) What was achieved last week?

- Improved and refined the Student DTOs used for transferring student data in the API.
- Enhanced the Student Controller endpoints for cleaner request handling and responses.
- Reviewed and improved the Get Students endpoint to properly retrieve student records.
- Refined the Create Student endpoint to correctly process incoming student data through DTOs.
- Tested the endpoints using Swagger to verify correct responses and functionality.

2.) What is the focus for today?

- Continue refining DTO structures for better data handling.
- Add validation for student input fields.
- Improve controller logic for better maintainability.

3.) What blockers exist?

- Ensuring compatibility between updated DTO structures and existing controller endpoints.

Retrospective

1.) What went well? (Wins/Successes)

- Successfully improved the structure and clarity of the Student DTOs.
- Controller endpoints became cleaner and more organized.
- Swagger testing helped confirm that the API endpoints were functioning correctly.

2.) What didn't go well? (Problems/Challenges)

- Updating DTOs required careful adjustments to avoid breaking the controller endpoints.
- Ensuring that request and response formats remained consistent during testing.

3.) What should we start doing? (Improvements)

- Implement input validation for student data.
- Standardize DTO structures for better consistency across modules.

4.) What should we stop doing? (Waste/Inefficiencies)

- Avoid modifying DTO structures without verifying their impact on controller endpoints.

5.) What should we continue doing? (Best Practices)

- Continue using Swagger to test and verify API endpoints.
- Maintain clear DTO structures and organized controller logic.
