

PROGRESS REPORT

STAND-UPS:

1. What was achieved last week?

- Last week, I continued designing and developing the **Student Interface** of the Attendance System, refining **Faculty Interface**, and began working on the **Admin Interface** using Figma.

The **Student Interface** includes a left-side navigation menu bar with the following sections:

1. Dashboard - Displays an overview of the student's attendance, including:

- Overall attendance percentage
- Number of classes present
- Number of classes absent
- Active course
- List of enrolled courses

2. My Attendance - Shows detailed attendance information such as:

- Total classes held
- Classes present
- Classes absent
- Attendance records

3. My Course - Displays course details and related information.

4. Alerts - Provides attendance warnings or important announcements.

5. Settings - Allows students to manage their profile information and notification preferences.

The **Faculty Interface** includes a left-side navigation menu bar with the following sections:

1. Dashboard - Overview and today's classes
2. Mark Attendance - Record student attendance
3. Reports - View attendance reports
4. Settings - Manage faculty settings

The **Admin Interface** includes a left-side navigation menu bar with the following sections:

1. Dashboard - Displays an overview of system activity, including key statistics such as:
 - Total students
 - Total faculty
 - Total courses

- Average attendance
2. Students - Allows the administrator to view, add, edit, or manage student records and information.
 3. Faculty - Provides tools to manage faculty profiles, including adding, editing, or viewing instructor details.
 4. Courses - Enables the administrator to create, update, and manage course information and assignments.
 5. Reports - Generates attendance reports and summaries that can be reviewed or exported for documentation.
 6. Settings - Allows the administrator to configure system settings, manage accounts, and update preferences.
 - General Settings
 - Course Rules
 - Leave Rules
2. What is the focus for today?
 - My focus for today is to start coding the front-end interface based on the wireframes I created. I will begin translating the design from Figma into the actual user interface layout.
 3. What blockers exist?
 - One blocker is that I do not fully know everything about coding yet, especially when implementing certain front-end elements. However, I plan to overcome this by researching, practicing, and gradually improving as I build the interface.

RETROSPECTIVE:

1. What went well? (Wins/Successes)
 - Successfully completed the Student, Faculty, and Admin interface wireframes.
 - Maintained a clear and organized layout across all interfaces.
 - Used Figma's design tools effectively to maintain consistency throughout the designs.
2. What didn't go well? (Problems/Challenges)
 - Some layout issues, such as spacing and alignment, needed adjustments.
 - Certain elements required resizing to maintain visual balance and readability.
 - Do not yet fully understand everything about coding, especially when implementing certain front-end elements.
3. What should we start doing? (Improvements)
 - Apply consistent design guidelines for spacing, typography, and layout.
 - Begin collecting early feedback to improve interface usability.
 - Continue researching, practicing, and improving while building the interface.

4. What should we stop doing? (Waste/Inefficiencies)

- Avoid placing elements without using grid alignment, as it can create inconsistent spacing.
- Reduce unnecessary layout adjustments by planning the structure before placing components.
- Avoid adding unnecessary elements that do not contribute to the design.
- Avoid procrastination and manage time more effectively.

5. What should we continue doing? (Best practices)

- Maintaining a clear and organized interface layout.
- Applying consistent spacing, typography, and alignment.
- Continuously learning and practicing front-end development.
- Follow clean and organized coding practices.
- Test code regularly to identify and fix errors early.
- Keep researching solutions and coding techniques when encountering problems.
