

PROGRESS REPORT

STAND-UPS:

1. What was achieved last week?

- Last week, I continued developing the Admin Interface of the Attendance System, removing the notification, import, and export buttons and began working on the Report and Settings part of the Admin Login Page.

The Admin Interface includes a left-side navigation menu bar with the following sections:

1. Dashboard - Displays an overview of system activity, including key statistics such as:
 - Total students
 - Total faculty
 - Total courses
 - Average attendance
2. Students - Allows the administrator to view, add, edit, or manage student records and information.
3. Faculty - Provides tools to manage faculty profiles, including adding, editing, or viewing instructor details.
4. Courses - Enables the administrator to create, update, and manage course information and assignments.
5. Reports - Generates attendance reports and summaries that can be reviewed or exported for documentation. **(Starting)**
6. Settings - Allows the administrator to configure system settings, manage accounts, and update preferences. **(Starting)**
 - General Settings
 - Course Rules
 - Leave Rules

2. What is the focus for today?

- My focus for today is to start coding the front-end Student interface based on the wireframes I created. I will begin translating the design from Figma into the actual user interface layout.

3. What blockers exist?

- One blocker is that I do not fully know everything about coding yet, especially when implementing certain front-end elements. Also, my team did not fully plan our design completely so there are some features that need to be removed.

RETROSPECTIVE:

1. What went well? (Wins/Successes)
 - Successfully completed the teacher-student-course part.
 - Maintained a clear and organized layout across all interfaces.
2. What didn't go well? (Problems/Challenges)
 - My team did not fully plan our design completely so there are some features that need to be removed.
 - Do not yet fully understand everything about coding, especially when implementing certain front-end elements.
3. What should we start doing? (Improvements)
 - Plan everything carefully with the team.
 - Begin collecting early feedback to improve interface usability.
 - Continue researching, practicing, and improving while building the interface.
4. What should we stop doing? (Waste/Inefficiencies)
 - Avoid adding unnecessary features that do not contribute well to the final system.
 - Avoid procrastination and manage time more effectively.
5. What should we continue doing? (Best practices)
 - Maintaining a clear and organized interface layout.
 - Continuously learning and practicing front-end development.
 - Follow clean and organized coding practices.
 - Test code regularly to identify and fix errors early.
 - Keep researching solutions and coding techniques when encountering problems.
